# The Chess Endgame Studies of Richard Réti : Knights and pawns 

White to play and win

White to play and win
2.1b

After 2...Kc3
2.1 and 2.2, composed with Artur Mandler, appeared as a twin study in L'Eclaireur de Nice in 1924. In fact they are difficult alternative solutions to a study by O. Trinks which had appeared shortly before in Oesterreichische Schachrundschau. By modifying Trinks's position slightly and shifting it one file each way in turn, Mandler and Réti created two much deeper studies each with a unique solution.

Let us therefore first look at Trinks's study, which is 2.1a. The strategic objectives are simple enough. White wants to advance his king to d2, after which the win will be easy; Black wants to play ...e3 and exchange off White's last pawn. Trinks therefore played 1 Ne 3 Kc 32 Ke 1 (see 2.1b) Kd3 3 Nd1 Kc2 4 Nb 2 (a startling but safe move, since $4 \ldots \mathrm{Kxb} 2$ will allow 5 Kd 2 and White will mop up) Kc1 ( $4 \ldots \mathrm{Kc} 35 \mathrm{Kd} 1$ with Kd 2 to follow) 5 Na 4 Kc 26 Nc 5 and the e-pawn goes, and 1 Ke 1 was supposed to be defeated by $1 \ldots \mathrm{Kc} 22 \mathrm{Ne} 3+\mathrm{Kc} 3$ (again giving 2.1b but this time with White to play) $3 \mathrm{Nd} 1+\mathrm{Kd} 34 \mathrm{Nb} 2+\mathrm{Kc} 2$ and 5 Na 4 no longer wins the e-pawn.

However, Mandler and Réti showed that even after reaching 2.1b with White to play, it was possible to maneouvre back to it with Black to play. This is quite remarkable, because neither of White's pieces can lose a move; the knight is intrinsically unable to do so, and the king, being constrained to the first rank, is here equally inflexible. The normal triangulation manouevre is therefore unavailable, but though White cannot himself triangulate he can force Black to do so. Suppose $1 \mathrm{Ke1} \mathrm{Kc} 22 \mathrm{Ne} 3+\mathrm{Kc} 3$ has got us to $\mathbf{2 . 1 b}$; then we can continue $3 \mathrm{Kd1} \mathrm{Kd} 34 \mathrm{Nd} 5 \mathrm{Kd} 4$ (4...Kc4 5 Nf 4 Kc 36 Kc 1 with either $6 . . . \mathrm{e} 37 \mathrm{Nd} 5+$ or $6 \ldots \mathrm{Kc} 4 / \mathrm{Kd} 47 \mathrm{Kd} 2$ ) 5 Nb 4 Kc 3 ( $5 \ldots \mathrm{Kc} 46 \mathrm{Kd} 2,5 \ldots \mathrm{e} 36 \mathrm{Nc} 2+$ ) 6 Nc 2 Kd 37 Ne 3 Kc 38 Ke 1 and mission accomplished.

This gives us the solution to 2.1: $\mathbf{1} \mathbf{N g} \mathbf{1}$ (we now have the position after 1 Ke 1 in the Trinks study, shifted one file to the right) Kd2 $2 \mathbf{N f 3}+\mathbf{K d} \mathbf{3}$ (2.1b shifted one file to the right but with White to play) $\mathbf{3} \mathbf{K e 1} \mathbf{K e 3}$ 4 Ne5 Ke4 (4...Kd4 5 Ng 4 Kd 36 Kd 1 with $6 \ldots \mathrm{f} 37 \mathrm{Ne} 5+$ or $6 \ldots \mathrm{Kd} 4 / \mathrm{Ke} 47 \mathrm{Ke} 2) \mathbf{5} \mathbf{N c} 4 \mathrm{Kd} 3$ (5...Kd4 6 Ke 2 , 5...f3 $6 \mathrm{Nd} 2+$ ) $\mathbf{6}$ Nd2 Ke3 7 Nf3 Kd3 8 Kf1 (back to the shifted 2.1b but with Black to play, after which we can play Trinks's finish) Ke3 9 Ne1 Kd2 10 Nc2 Kd1 11 Nb4 Kd2 12 Nd5.
(In Depth and Beauty, I pointed out that the computer gave 2 Nh 3 and $4 \mathrm{Ng} 5 / \mathrm{Nh} 4$ as alternative winning moves but that they wasted time, and the definitive results for $\mathrm{K}+\mathrm{N}+\mathrm{P} v \mathrm{~K}+2 \mathrm{P}$ now available have indicated further alternatives of this kind. However, valid but time-wasting alternatives for the winning side are almost inevitable in positions where the defender is wholly passive, and the question that matters is whether any of them allows White to bypass any feature which is a reason for the study's existence (here, the lose-a-move manoeuvre which gets back to the shifted 2.1b with White to play). Some exploratory analysis here suggests that none of them would, but to give a definitive answer would require the recalculation of the table of results for $\mathrm{K}+\mathrm{N}+\mathrm{P}$ $\mathrm{v} \mathrm{K}+2 \mathrm{P}$ with the shifted $\mathbf{2 . 1 b}$ artificially declared to be only a draw with White to play, and computing facilities capable of doing this are not currently available to me. Similar comments apply to $\mathbf{2 . 2}$, where again there are many valid but time-wasting alternatives along the way. There, the key position would appear to be $\mathbf{2 . 2 b}$; the detailed analysis which follows on the next page would seem to preclude any significant variation in the later play.)

The reason that $\mathbf{2 . 1}$ was shifted one file to the right is that the Trinks study can also be solved by bringing the White king into play via $\mathrm{g} 1 / \mathrm{h} 2 / \mathrm{g} 3$. In $\mathbf{2 . 2}$, the solution to 2.1 no longer works because the move corresponding to 11 Nb 4 would take the knight off the board, and it is this alternative mechanism that must be used.

Not at once however. After $1 \mathrm{Ne} 1 \mathrm{~Kb} 22 \mathrm{Nd} 3+\mathrm{Kb} 3 / \mathrm{Kc} 3$, try $3 \mathrm{Ke} 1 \mathrm{Kc} 24 \mathrm{Kf1}$ (see 2.2a). 4...Kd2 gives no trouble ( $5 \mathrm{Nf} 4 \mathrm{Kd1} 6 \mathrm{Kg} 2$ with Kf 3 etc to follow), but if White tries to do the same after $4 \ldots \mathrm{Kd} 1$, playing 5 Nf 4 Kd 26 Kg 2 , Black can reply $6 \ldots \mathrm{~d} 3$, and after 7 exd3 e2 White's pawn is lost. However, 4... Kd 1 is only possible because the Black king is on c2. If in 2.2a the Black king were on c3, White would win.

So let us put the White king back on d1, and try moving the knight away from d3 and only then taking the White king towards the east. In the position Kd1/Nf4 v Kb2, after White's Ke1, ...Kc2 fails against Nd3 (Black, being already on c2, must move away from it, and after say ...Kc3 White wins by Kf1 as we have just seen), and ...Kc1 is met by Ne6 and Nxd4. So the only correct move is ...Kc3, ready to meet Nd3 by ...Kc2. The same is true if the knight is on any other square which covers d3 and is within two moves of d4, namely b4, c5, or e5.

So if the White knight is covering d3 from b4, c5, e5, or f4, Black must reply to White's Ke1 by playing $\ldots \mathrm{Kc} 3$. We shall try to prevent this defence by reaching the position $\mathrm{Kd} 1 / \mathrm{N} \sim(\mathrm{Nb} 4, \mathrm{Nc} 5, \mathrm{Ne} 5, \mathrm{Nf} 4)$ with the Black king already on c3 and White to play.

From which of these squares, b4, c5, e5, and f4, can the knight force the Black king to play to c3? We can only do this by putting Black in zugzwang, so the knight must be guarding b3 at the instant when the Black king is on b2. So we discard b4/e5/f4, and concentrate on c5. This has taken us a further step backward (our analysis is essentially retrograde, starting from the position we want to achieve and seeing how we can force Black to let us get there): White must reach the position $\mathrm{Kd} 1 / \mathrm{Nc} 5 \mathrm{v} \mathrm{Kb} 2$ with Black to move.

From where could the knight have come to c5? If it is to force the king to move to $b 2$, it must be on a square from which it controls the one important square in the Black king's field, namely c3, and on a4 it would have been controlling b2 rather than forcing the Black king to move there. So it must be on e4. The position $\mathrm{Kd} 1 / \mathrm{Ne} 4 \mathrm{v} \mathrm{Kb} 3$, Black to play, is won for White because Black has no reasonable move other than ...Kb2, and White's reply Nc5 gives the position of the previous paragraph.

The position $\mathrm{Kd} 1 / \mathrm{Ne} 4 \mathrm{v} \mathrm{Kb} 3$ is however also won if White is to play, because Kc 1 forces Black to retreat and grant access to c 2 . So if the White knight can get to e4, he wins whether the Black king is on b2, b3, or c3.

To reach e4 from c5 is most improbable, since our whole purpose in getting to e4 is to use it as a stepping stone to c 5 . The square g 5 is likewise not a practical choice. The knight can reach this square only from f 3 or e6, and while it is doing this White will be unable to stop Black from playing ...Kc3 and ...d3.

So the practical options are d6 and f6, and the easier square to reach is f6. $1 \mathrm{Ne} 1 \mathrm{~Kb} 22 \mathrm{Nd} 3+\mathrm{Kb} 33 \mathrm{Nf} 4$ Kb2 (3...Kc3 4 Ke1 Kc2 5 Nd3 Kc3 6 Kf1 etc, see 2.2a) $4 \mathrm{Nd} 5 \mathrm{~Kb} 35 \mathrm{Nf} 6: ~ n o, ~ 5 \ldots \mathrm{Kc} 4$ ! This allows 6 Kc 2 , but after $6 \ldots \mathrm{~d} 3+7$ exd3+Kd4 White is powerless against the threat of ...e2. 6 Ne 4 likewise is met by $6 \ldots \mathrm{~d} 3$.

Only d6 is left. It is easy to see that the knight must reach this square from b5, since only from here can it keep a sufficient watch on the Black king. The final question, namely how to arrive at b5, can be answered only by a detailed move-by-move analysis, which Mandler does not give, but if we work forward from the opening position we find that any play for White other than $1 \mathrm{Ne} 1 \mathrm{~Kb} 22 \mathrm{Nd} 3+\mathrm{Kc} 33 \mathrm{Nc} 1 \mathrm{~Kb} 24 \mathrm{Na} 2 \mathrm{~Kb} 15 \mathrm{Nb} 4 \mathrm{~Kb} 2$ 6 Nd 5 Kb 37 Nc 7 allows Black either to draw at once by ...Kc3 and ...d3 or to threaten to do so and so force White to backtrack. And from c7, the knight has access to b5.

The solution thus unfolds 1 Ne1 Kb2 (1...Kb3 2 Nd 3 Kc 3 transposes) $\mathbf{2} \mathbf{N d} \mathbf{~} \mathbf{+}+\mathrm{Kc} 3(2 \ldots \mathrm{~Kb} 13 \mathrm{Nc} 1 \mathrm{~Kb} 2$ transposes, as does $2 \ldots \mathrm{~Kb} 33 \mathrm{Nf} 4 \mathrm{~Kb} 24 \mathrm{Nd} 5 \mathrm{~Kb} 35 \mathrm{Nc} 7$ ) $\mathbf{3} \mathbf{N c} 1 \mathrm{~Kb} 24 \mathbf{N a} 2 \mathrm{~Kb} 15 \mathbf{N b} 4 \mathrm{~Kb} 26$ Nd5 Kb3 7 Nc7 (see 2.2b) Kc3 (7...Kb2 8 Nb 5 and wins a pawn at once) $\mathbf{8} \mathbf{~ N b 5}+\mathrm{Kc} 49 \mathbf{N d 6}+\mathbf{K b 3} / \mathrm{Kc} 3$ ( $9 \ldots \mathrm{Kc} 5 / \mathrm{Kd} 510 \mathrm{Nf} 7$ ) 10 Ne4(+) Kb2 11 Nc5 Kc3 12 Ke1 Kc2/Kc4 13 Nd3 Kc3 14 Kf1 Kd2 and given is 15 Nf4 Kd1 16 Kg2 as long planned though 15 Ne 5 also wins ( $15 \ldots \mathrm{Kd} 116 \mathrm{Nf} 3$ and a pawn goes).

I don't know which is the more remarkable: the incredible knight journey c2-e1-d3-c1-a2-b4-d5-c7-b5-d6-e4-c5-d3 in itself, or the fact that it is required in a study with such a simple and natural starting position.

- The chess endgame studies of Richard Réti -

The most difficult pawn for the defender to handle in endings with knight and pawn against knight is the rook's pawn. The natural move in 2.3 (composed in 1929, and first published in Mandler's 1931 book) is 1 Kb 8 getting out of the pawn's way, but $1 . . \mathrm{Kb} 5$ refutes it ( $2 \mathrm{Nb} 4 \mathrm{Nc} 6+$ with $3 \mathrm{~Kb} 7 \mathrm{Na} 5+4 \mathrm{Ka} 7 \mathrm{Kxb} 45 \mathrm{~Kb} 6 \mathrm{Nc} 4+$ etc or $3 \mathrm{Kc} 7 \mathrm{Nxb} 44 \mathrm{a} 7 \mathrm{Nd} 5+$ and 5 ...Nb6). Correct is $\mathbf{1 ~ K a 7 ~ ( b l o c k i n g ~ t h e ~ p a w n ~ b u t ~ t h r e a t e n i n g ~ K b 6 ) ~ K b 5 ~}$ (1...Kc5 2 Nd 4 and Black has no good move) 2 Nb4 Ka5 (2...Kxb4 3 Kb6 etc) $\mathbf{3} \mathbf{K b 8}$ (see 2.3a) Nc6+ (3...Kxb4 4 Kc7 Ne6+ 5 Kb 6 ) 4 Kb7 (4 Kc7 Nxb4 5 a7 Nd5+ and 6...Nb6) Nd8+ 5 Kc7 (5 Kb8 Nc6+ repeats immediately, and if 5 Kc 8 then $5 \ldots \mathrm{Nc} 6$ forces 6 Kb 7 and $6 \ldots \mathrm{Nd} 8+$ again repeats) Ne6+ $\mathbf{6} \mathbf{K b 8}$ (simplest though 6 Kc6 also wins, the first point at which White has had a choice) Nc5 ( $6 . . . \mathrm{Kb} 67$ a 7 Nc 78 Nd5+) 7 a7 Nd7+ 8 Kc7 (simplest) Nb6 9 Kb7 Kb5 10 Nd5.
